

As stated in the Introduction,

Measurements were made at:-

Random Site 1 **

Random Site 2

Onich **

Achara

Ford **

Torbhlaran

Carnasserie **

4 non-lunar sites; Craigantairbh **, Taynuilt, Upper Fernoch, Barcaldine Castle Farm

(**= return visit to check possible alignment(s); Bold Italics = Chance alignment found)

=====

Results:-

In all a total of some 1500 degrees of random hilly horizon was assessed for chance alignments. This included 30 lunar bands. Two chance alignments were found. This gives a benchmark with which to compare the results of the precise alignments found from the stones.

- From the 15 stones which gave an indicated direction, 13 precise lunar alignments for $\pm\Delta$ were found **, one probable for the equinox and one probable indicator (to a hidden stone)
- From random sites two precise chance alignments were found in 30 lunar bands.

(** Each of these was either in the Lunar Band indicated or in the only lunar band visible from the stone.)
